Rajaram Magar

Pune, Maharashtra | rajarammagar101@gmail.com | +918624955714

Professional Summary

Software Engineer with close to 3 years of experience building high-performance, secure, and scalable **Java (17)** based backend systems in banking and financial domain. Strong expertise in **Spring Boot microservices, event-driven architectures, real-time transaction processing, and REST APIs**. Hands-on experience with **Spring Security (JWT/RBAC), PostgreSQL, RabbitMQ-based messaging, and CI/CD pipelines**. Proven ability to deliver reusable platform components, ensure code quality, and build systems aligned with payments-grade reliability and security.

Skills

Languages: Java (8/11/17) | SQL | Python (Intermediate)
Backend: Spring Boot | Spring Security | JPA/Hibernate | Feign Client | REST API Design
Databases: MySQL / PostgreSQL | Schema Design
Messaging & Integration: RabbitMQ | REST Clients | Third-party system integrations
Cloud & DevOps: AWS (EC2, RDS, S3) | Git | Docker | GitHub Actions | CI/CD | Jenkins | OpenShift | ELK Stack
Testing: JUnit | Mockito
Architecture & Concepts: DSA | System Design | Microservices | Event-Driven | Concurrency | Idempotency, Transaction.

Education

Government College of Engineering, Chandrapur, B.Tech Computer Science *CGPA: 9.56/10.0* *Aug 2019 – June 2023*

Experience

Tata Consultancy Services, Software Engineer *Pune, Maharashtra* *Aug 2023 – Present*

- **Banking & Financial Services Domain**
  - Designed and developed **10+ Spring Boot microservices** handling **high-volume financial transactions** including **digital wallets**, **prepaid virtual cards (top-up/redemption)**, and **core banking integrations**.
  - Built and optimized **25+ REST APIs**, improving **average response time by 20–30%** through query tuning and structured exception handling.
  - Implemented **idempotent transaction mechanisms**, reducing **duplicate financial operations by 40%** during retry scenarios.
  - Integrated **5+ downstream banking systems** using **Feign clients** with timeout, fallback, and retry strategies, improving **failure recovery by 30%**.
  - Designed **event-driven workflows using RabbitMQ**, reducing synchronous system load by **35%** and improving service scalability.
  - Resolved **wallet balance concurrency issues** using transactional boundaries and validation controls, ensuring **near 100% transaction consistency**.
  - Secured APIs with **Spring Security** and **role-based access control** for agent authentication and authorization.
  - Reduced **production issue resolution time by 40%** using centralized logging and traceability through **ELK stack**.
  - Maintained **80%+ unit test coverage** for core services using **JUnit and Mockito**.
  - Containerized microservices using **Docker** and **CI/CD pipelines with Jenkins**, reducing deployment effort by **50%**.
- **Engineering Automation Initiative**
  - Built an internal **API initializer tool** to auto-generate **controller, service, mapper, and model layers** from structured Excel inputs.
  - Reduced new service setup time by **60–70%** and standardized backend development practices across teams.
- **Data Architecture & Migration Initiative**
  - Contributed to migration of **legacy in-memory DataGrid storage** to **relational database architecture**.
  - Improved **data fetch performance by 25–30%** using in-memory caching & optimized batch processing strategies.
  - Ensured **data consistency and zero-loss migration** during system transition.

Certifications

AWS Certified Solutions Architect – Associate
September 2024

Google Cloud Certified Generative AI Leader
August 2025
